

PROANE SAFETY SOLUTIONS

## What is the Tank Right System?

### The Tank Right System:

- Is a unique safety device designed to eliminate the hazards associated with exchanging liquid propane tanks for industrial forklifts. Primarily, the device eliminates the risk for a worker subjected to a liquid propane burst.

- The Tank Right System acts as a safety cover which is mounted over the top of a liquid propane collar.

- Provides your business with a simple safety solution which can reduce the risk of violating OSHA safety policies.

- Minimizes the potential for safety related legal issues. Examples include, failing to provide workers with safety equipment or failure to enforce safety policies.

- Our device surpasses the propane safety standards set by OSHA by furnishing an Engineering Controlled solution. This is an alternative to commonly misplaced Personal Protective Equipment (PPE) and OSHA states that Engineering Controlled products are preferred.
